

# Pollinate

Most flowering plants need to be pollinated before they will produce seeds. Pollination occurs when pollen is transferred from the stamens to the stigma of flowers. Some flowers can self-pollinate, others require cross-pollination from another plant of the same species.

Although there are plants that can do it on their own, plants that are cross-pollinated are stronger, more diverse, and produce better seed quality. Pollination can occur with the help of wind or water, but mostly it happens with the help of animals.

I think this is a reminder of how important it is to do things within a community. We need each other.
